

## Domain Week 4: 5. Mobile Application Testing Lab

Name: Ryan Lobo

Submission Date: 1/4/26

### Executive Summary

The mobile application testing lab examined an Android APK using Genymotion and MobSF, with additional runtime tools such as Frida and Drozer for deeper validation. The audio notes show that the APK was analyzed in an emulator environment and that MobSF generated a report used as the basis for findings.

### Test Log

| Test ID | Vulnerability | Severity | Target App |
|---------|---------------|----------|------------|
|---------|---------------|----------|------------|

|     |                  |      |                    |
|-----|------------------|------|--------------------|
| 016 | Insecure Storage | High | InsecureBankv2.apk |
|-----|------------------|------|--------------------|

### Fifty-Word Summary

The lab used Genymotion, MobSF, Frida, and Drozer to analyze an Android banking APK in an emulator with USB debugging enabled. Static analysis in MobSF produced a report focused on insecure storage. The exercise established a safe workflow for reviewing app risks and documenting findings in a controlled environment.

### Checklist

- Run MobSF for static analysis.
- Hook app functions with Frida.
- Test IPC with Drozer.
